

AERZEN POSITIVE DISPLACEMENT BLOWERS

Aerzen canned blowers for conveyance of air and gases in
vacuum technology

AERZENER MASCHINENFABRIK
G M B H

Customer benefit by technical progress

Aerzener Maschinenfabrik has been manufacturing positive displacement blowers since 1868 (Roots design). Aerzener Maschinenfabrik is one of the oldest and biggest manufacturers worldwide and proud to be market leader in Europe.

Especially in vacuum technology Aerzen has an experience of more than 65 years.

Technical competence, experienced staff and continuous exchange with customers form an excellent basis for successful new developments in Aerzen.

Aerzener Maschinenfabrik gives priority to customer benefit. Thanks to innovative products manufactured by Aerzener Maschinenfabrik the market success of plant manufacturers and -users is a lasting one.

Application ranges

The new Aerzen blowers with canned drive are designed for the conveyance of air and neutral gases and are especially applied in the industrial high-vacuum technology. The blowers cover with a total of 14 sizes theoretical intake volume flows from 105 m³/h to 15.330 m³/h and pressure ranges up to 10⁻⁵ mbar abs.

Here are some examples of the various application ranges:

- Semiconductor industry
- Micro-electronics
- Production of flat screens
- Laser technology
- Solar technology
- Helium leak indicating units
- Chemical process technology
- Foil- and glass coating
- Manufacture of melting furnace
- Evacuation of hydrogen
- And many others

Construction and installation

Aerzen vacuum blowers are provided with o-ring sealings at the casing flanges. Further important advantages of the blower stage are the vacuum-tightness and air cooling. The lube oil supply is carried out by oil splash lubrication. As lubricant mineral oil can be used as well as the PFPE-oil mostly used in semiconductor technology.

The conveying room is protected by combined oil slinger-piston ring labyrinth sealings. Additionally, an amply dimensioned neutral chamber with condensate channels is installed. Optionally the neutral chamber can be purged with seal gas, in order to achieve an increased sealing effect. The integrated canned motor ensures the sealing of the drive shaft, a shaft passage to atmosphere can be omitted. Regarding the motors it can be chosen between a high-frequency design with a maximum speed of 7.400 rpm (125 c/s) and a corresponding frequency converter or a system frequency design with a maximum speed of 2.970 rpm at 50 c/s resp. of 3.565 rpm at 60 c/s.

Thanks to the water cooling of the motor, Aerzen canned blowers are appropriate for the application under clean-room conditions. Air-cooled canned motors can be delivered upon request.

The canned material is made of special, corrosion-resistant stainless steel, which has been tested successfully in an endurance material test with aggressive media of the semiconductor technology.

Depending on type of process it can be selected between two high-frequency motor variants: For continuous operation vacuum blowers with a max. load of 50 mbar are available. For cyclic operation of the vacuum blowers with a load of up to 150 mbar (< 5 minutes), there are special designs realizing shortest pump periods. The range of motors is completed by system motors for 50 or 60 c/s with a max. load depending on blower size of up to 75 mbar.

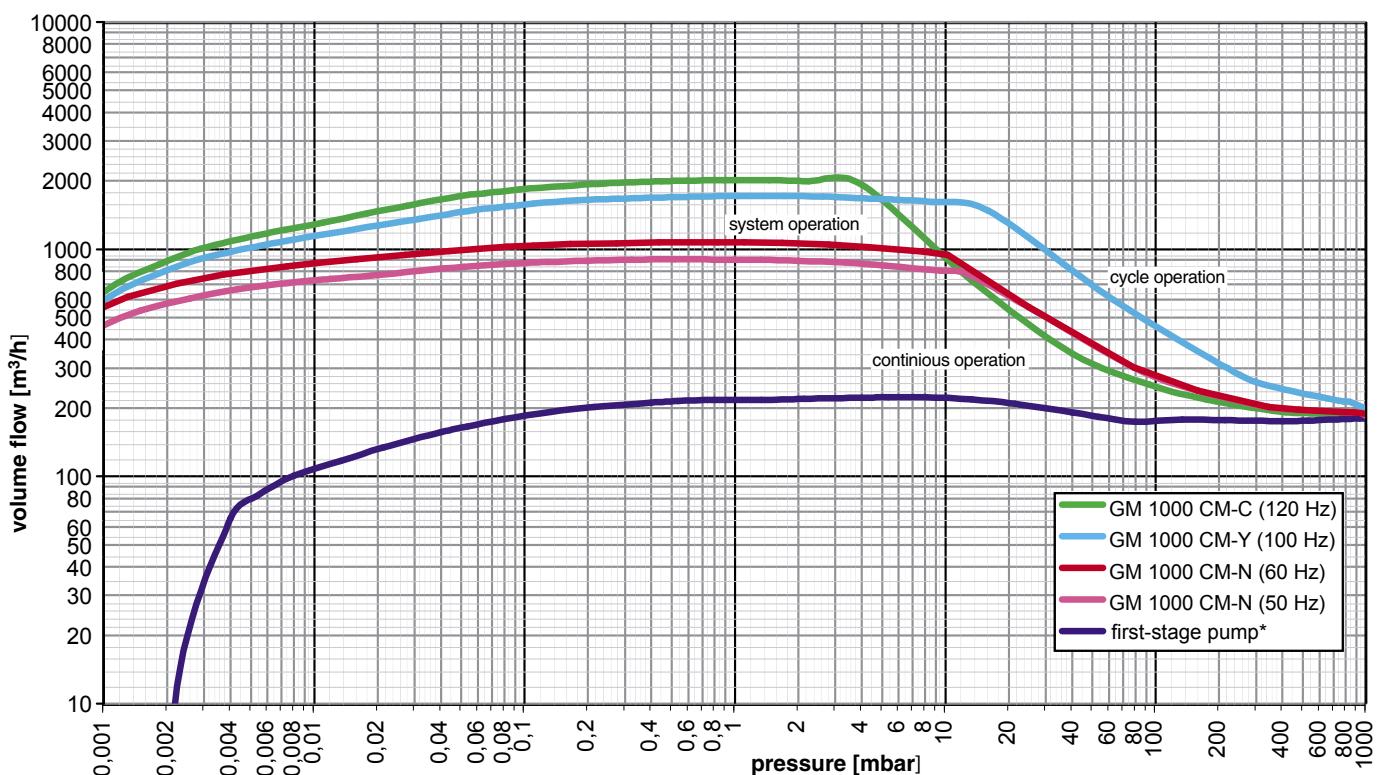

Advantages for the customer

- Biggest canned blower series with 14 sizes and volume flows of 105 m³/h to 15.330 m³/h
- ATEX-certification for zone 0 (internal)
- Optimum selection possibilities by 4 different motor variants
- Pressure ranges from 10⁻² to 10⁻⁵ mbar abs.
- High mechanical load (up to 150 mbar) and therefore, decrease of pump-down periods
- Only little consumptions of water, nitrogen and oil
- Appropriate for the application under clean-room conditions
- Big control range by means of frequency converter from 1.450 to 7.400 rpm resp. from 1.240 to 2.900 rpm
- Vertical and horizontal conveying direction possible Aerzen reliability
- Excellent price-/performance ratio

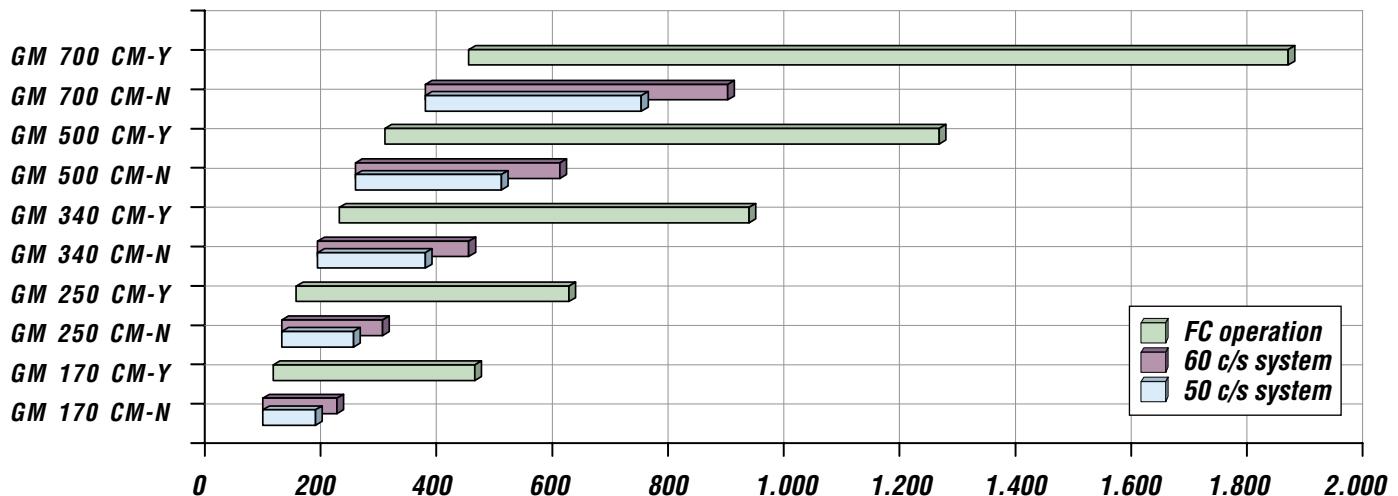

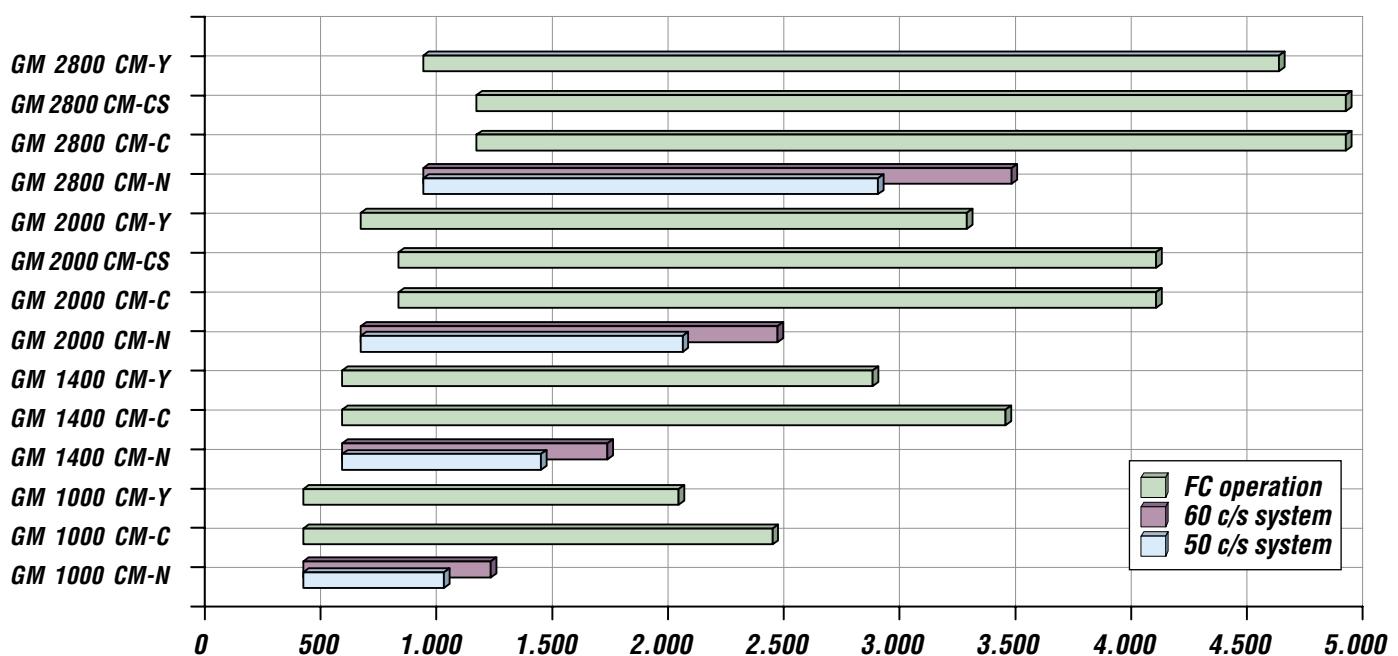

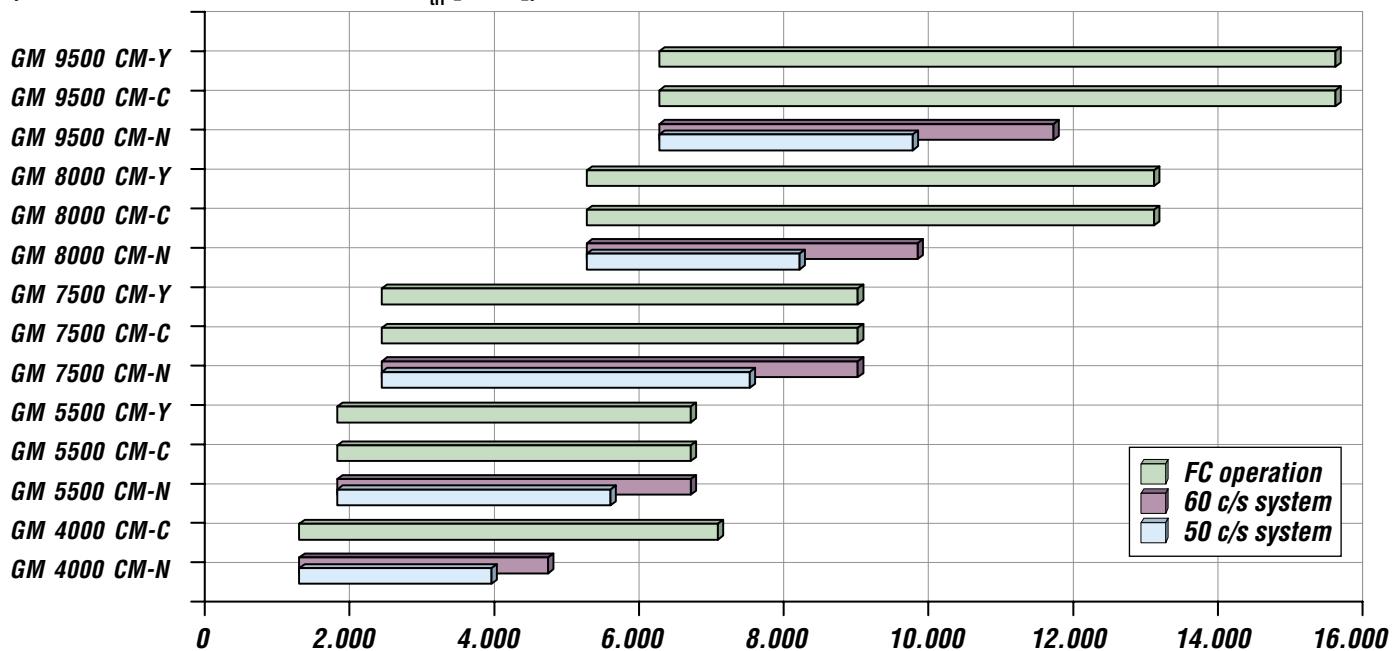

Exemplary performance curves with Aerzen canned motors

Ranges of application of Aerzen canned motor blowers

(theor. nominal intake volume S_{th} [m³/h])

Definition of abbreviations e.g.: GM 170 CM-N

G:	blower	-C:	high frequency, continuous operation e.g. process application
M:	vertical conveying direction	-CS:	high frequency, continuous operation e.g. process application
L:	horizontal conveying direction	"special short design"	
number:	volume flow at 50 Hz	-Y:	high frequency, cycle operation e.g. load lock application
CM:	canned motor	mode S1:	continuous operation
HM:	canned motor for aggressive gases	mode S2:	cycle operation
-N:	system frequency
